                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC derived from beta c cDNA clone is used for screening and cloning a liver activin beta e gene. Disorders of cell growth or differentiation (or susceptibility to them) are diagnosed by measuring liver activin gene conditions and cloning a liver activin beta e gene. Disorders of cell growth or differentiation (or susceptibility to them) are diagnosed by measuring liver activin gene conditions of haematopolesis, erythroid differentiation, ovarian follicular conformation, insulin secretion, neuronal survival, spermatogenesis, bone formation, insulin secretion or cardiac morphogenesis are some conditions can be diagnosed using the liver activin. Cell growth and compound or agent that upregulates the compound's expression. Antagonists can be used to treat liver diseases while agonists can be used to compound may also induce bone growth (e.g. for treating osteoporosis or treating haematopolesis, particularly erythropolesis, e.g. for treating haemophilia, cystic fibrosis or menstrual disorders. Antibodies bind to liver activin receptors) and to inhibit liver activin. Also, transgenic animals containing liver activin gene can be used to produce or the transgenic animals, are useful for screening for liver activin. Also, the transgenic animals, are useful for screening for liver activin.

New isolated nucleic acid encoding sub-units of liver activin useful for regulating growth and differentiation of cells, e.g. for treating liver, bone and haematopoletic disorders

Disclosure; Fig 4D-G; 141pp; English.

CC insulin secretion, neuronal survival, spermatugenesis, bone formation, cainsulin secretion, neuronal survival, spermatugenesis, bone formation, coinsulin secretion or cardiac morphogenesis are some conditions that can be diagnosed using the liver activin. Cell growth and differentiation can compound the sexpression. Antagonists can be used to treat cupregulates the compound's expression. Antagonists can be used to treat colliver diseases while agonists can be used to increase growth and correspond to the second of the liver tissue. The liver activin compound may also induce compound to the second of compound to the second of consequences of the second of the seco This cDNA encodes a murine liver activin beta c polypeptide. Sequences CC derived from beta c cDNA clone is used for screening and cloning a liver activin beta e gene. Disorders of cell growth or differentiation (or CC susceptibility to them) are diagnosed by measuring liver activin gene cactivity or by detecting a mutation in the liver activin gene. Disorders CC activity or by detecting a mutation in the liver activin gene. Disorders CC increase in the liver activin gene conditions can be diagnosed using the liver activin. Overlan follicular CC compound or agent that upregulates the compound's expression. Antagonists can be used to treat liver diseases while agonists can be used to compound may also induce bone growth (e.g. for treating haemophilia, cystic fibrosis or menstrual disorders. Antibodies care useful in immunoassays, to generate anti-idiotypic antibodies'(which liver activin receptors) and to inhibit liver activin. Also, the liver activin containing liver activin gene can be used to produce transgenic animals containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins, containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins, containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins, containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins, containing liver activin gene activin. them) are diagnosed by measuring liver activin gene activity or by detecting a mutation in the liver activin gene. Disorders of haematopoiesis, erythroid differentiation, ovarian follicular maturation, This represents the sequence of mouse activin genetic loci. The invention relates to murine beta c and beta e polypeptides and the genes encoding them. Disorders of cell growth or differentiation (or susceptibility to

                                                                                                                                                                                                                                                                                                                                                                                                                       A cDNA library prepared using total RNA from human liver was subjected to PCR amplification using primers corresp. to conserved regions within the TGF-beta family. Amplification products were subcloned and sequenced; one clone (designated pSK-MP121) was found to contain a new sequence. Part of the insert from this clone was used to re-screen the human liver cDNA library and a 2272 bp fragment (i.e. the present sequence) coding for a TGF-beta-like protein was isolated. The protein encoded by the cDNA insert has mitogenic and differentiation-inducing properties making it or fusion proteins comprising it or heterodimers of the protein with a cystine knot mottlf protein) useful for inducing tissue regeneration.

                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a protein (I) selected from the members of the transforming growth factor-beta (TGF-beta) superfamily, which is monomeric due to substitution or deletion of a cysteine which is responsible for dimer formation. Also described are: (I) nucleic acid (II) encoding (I); (2) expression vector (III) containing (II) in a suitable vector system; (3) host cell (IV) containing (II) capable of producing (I); and (4) a pharmaceutical composition (V) containing (I), (II) or (IV). (I) has vulnerary, antiulcer, nootropic, neuroprotective, antiinferfility and osteopathic activities, and can be used in gene therapy. (V) is useful for the prevention or therapy of diseases for which also the dimeric form of the protein would be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel monomeric protein of transforming growth factor-beta family for prevention or therapy of diseases associated with bone, cartilage damage, promotion of wound healing, has substitution or deletion of

                                The sequences given in AAQ47709-10 represent embryo and liver derived human transforming growth factor-beta (TGF-beta) genes repectively. The proteins encoded by these sequences may be used in a pharmaccutical composition for the treatment of various bone, cartilage or tooth defects and in tissue and wound repair processes. These proteins may also be used as immunosuppressors in organ transplants and in cosmetic surgery. Antibodies raised against these proteins may be
                            cosmetic surgery. Antibodies used for diagnostic purposes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAV38239 standard; DNA; 5099 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Liver activin; beta c; beta e; cell differentiation; haematopolesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    121
secretion or cardiac morphogenesis are some conditions that can be diagnosed using the liver activin. Cell growth and differentiation can be stimulated by treatment with an liver activin compound or agent that upregulates the compound's expression. Antagonists can be used to treat liver diseases while agonists can be used to increase growth and regeneration of liver tissue. The liver activin compound may also induce bone growth (e.g. for treating osteoporosis or osteomalacia) or haematopolesis, particularly erythropolesis, e.g. for treating haemophilia, cystic fibrosis or menstrual disorders. Antibodies are useful in immunoassays, to generate anti-idiotypic antibodies (which bind to liver activin receptors) and to inhibit liver activin. Also, transgenic animals containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-MAY-1998.

Disorders of cell growth or differentiation (or Susceptibility to them) are diagnosed by measuring liver activin gene continuing the CC activity or by detecting a mutation in the liver activin gene. Disorders CC maturation, hormone secretion, neuronal survival, spermatogenesis, bone that can be diagnosed using the liver activin. Cell growth and CC differentiation can be stimulated by treatment with an liver activin can be used to treat liver diseases while agonists can be used to compound may also induce bone growth (e.g. for treating basemound by also induce bone growth (e.g. for treating basemothilia, cystic fibrosis or menstrual disorders. Antibodies bind to liver activin receptors) and to inhibit liver activin. Also, the liver activin care setful in immunoassays, to generate anti-idiotypic antibodies (which liver activin receptors) and to inhibit liver activin. Also, the liver activin (in correctly processed and modified forms) proteins, modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

Five clones were isolated, including clone M3. They were subcloned in pUC19 and used to transform competent E.coli HB101 cells. Transformant E.coli HB101/pXar3 coding for the M3 BNP was sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 687 BP; 210 A; 145 C; 149 G; 179 T; 4 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAK94607;
                                                                                                                                                                                                                                                                                                                                  molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed and constitutions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 08-JUL-1999; 99JP-0194486

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1184 AGTTAGC 1190
                                      A cDNA clone (AAT16883) codes for human growth differentiation factor-12 (GDF-12 - AAR92754), a new member of the transforming growth factor beta superfamily that is expressed specifically in liver. It was obtd. from an adult liver cDNA library in lambda ZAP II using a GDF-12 probe obtd. by PCR amplification (see also AAT16884-93) of mouse cDNA. The isolated sequence can be incorporated into a vector and used for prodn. of recombinant GDF-12 in transformed host cells or used to design GDF-12 antisense polynocleotides useful for treating cell proliferative disorders associated with GDF-12 expression, esp.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              activin. Cell growth and differentiation can be stimulated by treatment with an liver activin compound or agent that upregulates the compound's expression. Antagonists can be used to treat liver diseases while agonists can be used to increase growth and regeneration of liver tissue. The liver activin compound may also induce bone growth (e.g. for treating expthropoiesis or osteomalacia) or haematopoiesis, particularly erythropoiesis for treating hematopoiesis, particularly expthropoiesis for treating hematopoiesis, to generate antidisorders. Antibodies are useful in immunoassays, to generate antidiotypic antibodies (which bind to liver activin receptors) and to inhibit liver activin. Also, transgenic animals containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins, or the transgenic animals, are useful for screening for liver activin modulators.

The invention provides murine liver activin beta c and beta e genes. Disorders of cell growth or differentiation (or susceptibility to them) are diagnosed by measuring liver activin gene activity or by detecting a mutation in the activin gene. Disorders of haematopoiesis, crythroid differentiation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 spermatogenesis, bone formation, insulin secretion or cardiac morphogenesis are some conditions that can be diagnosed using the liver activin. Cell growth and differentiation can be stimulated by treatment

Also claimed are non chromosomal DNA encoding inhibin-alpha or an inhibin-beta chain. Sequencing of inhibin-encoding cDNA has led to the identification of prodomain regions located N-terminal to the mature inhibin chains that represent coordinately expressed biologically active polypeptides. The prodomain regions or

Also claimed are non chromosomal DNA encoding inhibin-alpha or an inhibin-beta chain. Sequencing of inhibin-encoding cDNA has led to the identification of prodomain regions located N-terminal to the mature inhibin chains that represent coordinately expressed biologically active polypoptides. The prodomain regions or prodomain immunogens are useful in monitoring preproinhibin processing in transformant cell culture or in experiments directed

Expression of (I) in a sample indicates the differentiation of embryonic stem cells into a tissue selected from brain, heart, kidney, liver, lung, skeletal muscle or pancreatic tissues. (I) and (II) are used to produce an expression profile that defines a metabolic or developmental process, treatment, condition, disease or disorder. The gene profile can be used for dispossis, prognosis or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a cancer, immunopathology or neuropathology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           04-NOV-1999;
